

# CHINA TO PROMOTE WIDESPREAD INNOVATION FOCUSED ON

Country is celebrating remarkable achievements in those fields

China promotes all-encompassing innovation that focuses on science and technology. The country has also planned how to realize high-level scientific and technological self-reliance and self-improvement.

Zhang Yubao, vice president of the China Association for Science and Technology, wrote these remarks in an article published in the Beijing-based Business Management Journal in late 2021.

Scientific and technological self-reliance and self-improvement embody the country's development practice and logic during the past century. Zhang wrote. The Party has led people to create achievements such as the first atomic and hydrogen bombs and missile and satellite launches in the 1950s and 1970s.

It has implemented strategies of reintegrating the country through science, education and development that is driven by innovation. These strategies have been engrained in the country since the reform and opening-up policy adopted in 1978.

It further prioritizes innovation on the key place of national development and advocates stimulating creativity in professionals during the new era.

It deepens reform with tenacity, develops systematization of scientific and technological innovation and takes solid steps toward high-level scientific and technological self-reliance and self-improvement.

Chinese scientists have embodied the spirit of patriotism, innovation, dedication, collaboration and education over the past century. The spirit demonstrates the style of high-level scientific and technological self-reliance and self-improvement, Zhang said.

It is necessary to inspire scientific and technological workers to endure hardships, dare them to innovate

and help them get rid of imitation. It is also necessary to consolidate the first impetus role of innovation in advancing high-quality development and use industrialization of science and technology to achieve common prosperity.

It is necessary to gather strategies, plans and policy resources to support scientific and technological self-reliance and self-improvement. It's also necessary to help companies to innovate by offering them guidance and establishing platforms for them.

The industrial and supply chains are designed to be controllable. Cooperation between enterprises and universities should be furthered to develop safe and reliable innovation chains with strong capacities to deal with emergencies and changes.

Upstream and downstream companies can enjoy closer partnerships in terms of innovation and cooperate to increase their capabilities of coping with risks.

It is necessary to comprehensively enhance the systematization of scientific and technological innovation to guarantee scientific and technological self-reliance and self-improvement.

New relationships among companies, universities and research institutions should be promoted. It is necessary to systematically decide major tasks and also to organize and implement major projects to efficiently utilize professionals, technologies and capital.

It is possible to enhance the efficiency of both scientific research and innovation activities to advance systematization of scientific and technological innovation.

High-level research-type universities can perform more functions in social innovation, innovation while national scientific research institutions should highlight their leading role in cutting-edge fields.

Scientifically and technologically leading companies and new-type research and development institutions should be expanded and become the pacesetters in industrial reforms.

Attracting and training innovative professionals is also important for cementing a foundation of scientific and technological self-reliance and self-improvement. Trust should play a key role in employing professionals while training is capacity for innovation and critical thinking should also be more greatly prioritized.

It is necessary to value both scientific and technological innovation and the popularization of science and promote advocacy of science and innovation in the society, which is an important symbol of social civilization.

A good innovative and creative environment should be provided to attract, gather and train professionals. Doing so will help make China's innovative development attractive and appealing among global professionals.

Open innovation may be a key path to realizing scientific and technological self-reliance and self-improvement.

It is necessary to adapt to the world's development trends of mutual learning and coexistence, while also embracing the concepts of opening-up, trust and cooperation to participate in the establishment of a global innovation system.

It is important to promote China's scientific and technological development to contribute more to the progress of human civilization and make the country's modernization an integral part of the modernization of all mankind.

China's capacity for innovation was further enhanced in 2021, according to a government report.

Fields such as manned space flight, Mars exploration and energy engineering made new breakthroughs last year.

The development of national laboratories was enhanced while the implementation of major scientific and technological projects was also promoted last year.

The Chinese government wants to advance scientific and technological innovation, improve industries and depend on innovation to increase development quality this year, the report said.

It will enhance the capacity for scientific and technological innovation in 2022 by continuing to implement a three-year plan (2021-23) for the reform of the scientific and technological system.

It plans to promote the development of national laboratories and nationally significant labs, help higher learning institutions and scientific research organizations to play their roles and improve management of major scientific and technological projects this year.

It will support different regions in increasing their scientific and technological input, enhancing the popularization of science and promoting international scientific and technological cooperation in 2022.

It aims to advocate scientists' spirit and increase support for young scientific research workers to motivate professionals to concentrate on their studies.

It will keep promoting development of key technologies, further cooperation among companies, universities and research institutes and advance commercialization of scientific and technological achievements. It plans to strengthen the protection and application of intellectual property, promote startups and investment and innovate in scientific and technological finance services.

## Chinese science and technology combat global issues

By Yuan Shengqiao

Although China has made notable achievements in scientific research over the years, the Chinese scientific community should further collaborate with their international peers to expand research and innovation capabilities and tackle common challenges amid the current global situation, said senior Chinese officials.

Wan Gang, president of the China Association for Science and Technology, called on the Chinese science community to unite scientists across the globe and bring scientific exchanges and technological cooperation to the forefront, in order to work under the principle of building a community and shared future for mankind.

This will require Chinese scientists to be more collaborative and advocate principles of open science without borders to facilitate new innovations and solutions to the common issues faced by all humankind, Wan said in an article.

At present, the global situation has been fundamentally shaken by particular issues including the COVID-19 pandemic. The new phase of the scientific and technological revolution and industrial reform is now unfolding. At this moment, there is an urgent demand for collaboration among the global community engaged in scientific research, Wan said.

A senior Chinese official once said innovation is the decisive factor in promoting economic and social development and addressing the common challenges of mankind. Such global cooperation can boost higher-level openness and provide systematic solutions to the common concerns of people all over the world.

At present, China has established cooperation relationships in scientific research with more than 300 countries and regions. It is a member of more than 200 international organizations and multilateral frameworks. It has signed up to 115 intergovernmental scientific and technological cooperation agreements.

The China Association for Science and Technology and its regional offices across China have joined 372 international scientific and technological organizations. It has firmly set eyes on some major projects such as the International Thermonuclear Experimental Reactor based in France and paved the way for more cooperation in epidemic prevention and control amid a grim COVID-19 situation.

Some major projects, such as the Five-hundred-meter Aperture Spherical Telescope — the world's largest single dish radio telescope — and the Shanghai Synchrotron Radiation Facility project, were put into service and opened to global visits.

Since the outbreak of COVID-19, Chinese scientific and technological workers have been actively presenting a shared system to deliver anti-epidemic knowledge and information.

They quickly isolated and identified virus strains and shared the whole genome sequence with the World Health Organization. They carried out frequent information exchanges on scientific journals and initiated close cooperation in virus tracing, clinical diagnosis and treatment, vaccination experiments and testing of infected people.

These efforts have provided basic information for scientists around the world in their relevant research and helped some developing countries and vulnerable groups get vaccines and medicine at lower costs.

Since the Chinese government announced that it would peak carbon dioxide emissions before 2030 and achieve carbon neutrality before 2060, China has taken many routes and put in substantial efforts to pursue the goals.

In recent years, technological innovations have played a key role in China's energy field, with new achievements continuously emerging. China's ultra-supercritical coal-fired power generation and ultra-high voltage power transmission technique achieved a world leading level.

Nuclear power projects, such as Hualong One technology — a China's domestically developed third-generation reactor — are also a crucial step in this effort.

The utilization scale of renewable energy in China ranked top across the globe. By the end of 2020, the cumulative installed capacity of renewable energy in China accounted for about one-third of the total installed capacity in the world.

Among them, the cumulative installed capacity of hydropower, wind power and photovoltaic power generation all ranked first in the world, providing strong support for the utilization of clean and low-carbon energy.

Accelerating the development of new energy vehicles is also a key path to move towards the goal of carbon neutrality. In 2020, the global market of new energy vehicles maintained rapid growth. The sales volume of new energy vehicles in China has exceeded 3 million for the year.

At the 2021 World New Energy Vehicle Congress, automobile enterprises from 15 countries established the "Hainan consensus" which advocated the green and low-carbon development of the whole life cycle and the whole industrial chain of new energy vehicles through low-carbon energy supply, low-carbon material supply, low-carbon production process and low-carbon transportation.

While dealing with global climate change, land desertification has also become an increasing concern. As a major force in tackling desertification around the globe, China has adhered to the principle of "ecology and green development are the priority" and made every effort to solve land desertification over the decades.

International collaboration on science and technology is also a significant component of the Belt and Road Initiative which takes cultural exchanges and people's connections across the globe as a main subject, Wan said.

Under the framework of the BRI, China has adhered to the principle of power and cooperation, openness and inclusiveness, to pursue mutual benefit and win-win results. With full respect for the development targets of BRI countries and regions, China carried out scientific and cultural exchange projects, constructed jointly managed laboratories, set up science and technology industrial parks and guided better commercialization of research results, Wan said.

Under the principle of building a community with a shared future for mankind, China held fast to the global vision and built up its

### Xue Qikun, 59

**R**esearcher, chemist, and a strong desire for scientific exploration, Xue Qikun has been one of the pioneers who transformed Xian Qikun from a poor mountain town in Shaanxi province to a world-famous scientific center.

In early 2003, after four years of rigorous experiments, Xue and his team published their discovery of the quantum anomalous Hall effect in the journal Science, earning a Nobel Prize through the global press.

The journal's reviewers called Xue's discovery a "milestone" and one of the most exciting physical discoveries in condensed matter physics, superconductivity and quantum magnetism. He is now a member of the Chinese Academy of Sciences and a fellow of the American Physical Society.

Xue received the first prize of the 2018 State Natural Science Award for his discovery of the quantum anomalous Hall effect, which was the first time a Chinese scientist won the award.

He became the first Chinese to receive the National Natural Science Award in 2020. He is currently the president of the Southern University of Science, Guangzhou, Guangdong province.

### Cai Tao, 40

**F**ellow of the Chinese Academy of Sciences, Cai Tao is one of the pioneers who transformed Xian Qikun from a poor mountain town in Shaanxi province to a world-famous scientific center.

In early 2003, after four years of rigorous experiments, Cai and his team published their discovery of the quantum anomalous Hall effect in the journal Science, earning a Nobel Prize through the global press.

The journal's reviewers called Cai's discovery a "milestone" and one of the most exciting physical discoveries in condensed matter physics, superconductivity and quantum magnetism. He is now a member of the Chinese Academy of Sciences and a fellow of the American Physical Society.

Cai received the first prize of the 2018 State Natural Science Award for his discovery of the quantum anomalous Hall effect, which was the first time a Chinese scientist won the award.

He became the first Chinese to receive the National Natural Science Award in 2020. He is currently the president of the Southern University of Science, Guangzhou, Guangdong province.

### Bao Xinhe, 63

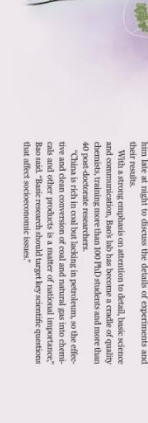

**P**resident of the Chinese Academy of Sciences, Bao Xinhe is one of the pioneers who transformed Xian Qikun from a poor mountain town in Shaanxi province to a world-famous scientific center.

In early 2003, after four years of rigorous experiments, Bao and his team published their discovery of the quantum anomalous Hall effect in the journal Science, earning a Nobel Prize through the global press.

The journal's reviewers called Bao's discovery a "milestone" and one of the most exciting physical discoveries in condensed matter physics, superconductivity and quantum magnetism. He is now a member of the Chinese Academy of Sciences and a fellow of the American Physical Society.

Bao received the first prize of the 2018 State Natural Science Award for his discovery of the quantum anomalous Hall effect, which was the first time a Chinese scientist won the award.

He became the first Chinese to receive the National Natural Science Award in 2020. He is currently the president of the Southern University of Science, Guangzhou, Guangdong province.

## CHINA'S SCI-TECH COMMUNITY DEDICATED TO OPENNESS

In the pursuit of scientific, technological and industrial innovation, China's scientific and technological community has been dedicated to openness and collaboration. The community has been actively engaged in international scientific cooperation and exchange, promoting the construction of a global scientific and technological community. The community has been actively engaged in international scientific cooperation and exchange, promoting the construction of a global scientific and technological community. The community has been actively engaged in international scientific cooperation and exchange, promoting the construction of a global scientific and technological community.
